BEFORE THE  
CALIFORNIA ENERGY RESOURCES CONSERVATION  
AND DEVELOPMENT COMMISSION

In the Matter of:	)	
	)	
BUILDING ENERGY EFFICIENCY	)	
STANDARDS, CALIFORNIA CODE OF	)	DOCKET NO:
REGULATIONS, TITLE 24, PART 1	)	02-NFRC-1
and PART 6	)	
	)	

---

CALIFORNIA ENERGY COMMISSION  
1516 NINTH STREET  
HEARING ROOM A  
SACRAMENTO, CALIFORNIA

WEDNESDAY, NOVEMBER 13, 2002  
10:15 A.M.

Reported by:  
Peter Petty  
Contract No. 150-01-005

PETERS SHORTHAND REPORTING CORPORATION (916) 362-2345

COMMITTEE MEMBERS

Robert Pernell, Presiding Member

Arthur Rosenfeld, Associate Member

HEARING OFFICER, ADVISORS

Rosella Shapiro, Advisor

STAFF PRESENT

William Pennington

Tony Rygg, Project Manager

ALSO PRESENT

Jim Benney, Director of Education  
National Fenestration Rating Council

Christian Kohler, Visiting Researcher  
Ernest Orlando Lawrence Berkeley National  
Laboratory  
University of California Berkeley

Ray Bjerrum  
Merzon Industries

Charlie Macher  
Blomberg Window Systems

Marvin Stover  
Mikron Industries

Ken Nittler  
Enercomp

Jim Mattesich, Attorney  
Livingston and Mattesich  
Blomberg Windows

## P R O C E E D I N G S

10:15 a.m.

PRESIDING MEMBER PERNELL: My name is Commissioner Robert Pernell. I chair the Energy Efficiency Committee. Commissioner Rosenfeld is in a meeting now. He will be down shortly to join us. Also on the dais with me is my Advisor, Rosella, first Advisor I might add, and the boss in some instances.

MS. SHAPIRO: We are not on the record with this.

(Laughter.)

PRESIDING MEMBER PERNELL: This morning the Committee hearing is for the purpose of receiving comments on the rulemaking to update the Commission's energy efficiency standards to reflect the current NFRC rating procedures.

The gentlemen that will be conducting the hearing this morning is Mr. Pennington. And at this time I'd like to turn the hearing over to Bill.

MR. PENNINGTON: Okay, thank you, Commissioner. My name is Bill Pennington. I manage building standards development activities at the Energy Commission. And welcome to this

1 hearing.

2 The purpose of this proceeding is to  
3 adopt, basically to update the reference for doing  
4 window testing certification and labeling to the  
5 updated version of NFRC test procedures.

6 The standards currently are based on  
7 existing test procedures that were last updated in  
8 1997 timeframe. And this proceeding is to adopt  
9 and to update to the new procedures. And to do so  
10 in a timing that is consistent with the timing  
11 that NFRC has decided for allowing manufacturers  
12 to transition to the new test procedures.

13 This is actually a fairly routine kind  
14 of thing for a adoption authority to do. It's  
15 quite common for the reference standards and test  
16 procedures that an adoption authority adopts by  
17 reference in their standards change. And it's  
18 quite common for there to need to be a updating  
19 when that happens.

20 And I guess, as always, there's some  
21 consequences to the people that are affected by  
22 those test procedures, either positively or  
23 negatively. But, in general, this is a quite  
24 common activity. And so we're trying to pursue  
25 this expeditiously.

1           The last thing we want to have happen is  
2     for there to be some sort of gap in the  
3     availability of labels for labeling window  
4     products in the field. We think that that would  
5     be basically dire consequences to us, given that  
6     we're so dependent on labeling and we have adopted  
7     labeling procedures to enable our building  
8     officials to properly enforce our building  
9     standards.

10           So, we're anxious to update to the new  
11    test procedures so that there will be essentially  
12    an easy transition here without any gap of  
13    labeling in the field.

14           This is a formal rulemaking proceeding,  
15    so we have started a 45-day comment period, and  
16    we're about two and a half weeks into that comment  
17    period. And this is the Committee hearing that  
18    will be held on it. And so we're interested in  
19    people's comments.

20           There are some presentations here that  
21    we have planned. And then after those  
22    presentations we'll all on people who have given  
23    me a blue card. I have four blue cards at this  
24    point to get comments.

25           So, this is being recorded so that we

1 can have a transcript of the proceeding. So, if  
2 you want to speak you need to be recognized and  
3 come up either to the lectern or to the table here  
4 and speak into the microphones.

5 All right, so with that, could I have  
6 Jim Benney make his presentation.

7 MR. BENNEY: The majority of this  
8 presentation just discusses affects of NFRC 100  
9 and U factor. NFRC also updated 200 and 400,  
10 changes at 400 are actually there's none. Changes  
11 in 200 are fairly insignificant. So these changes  
12 are 1997 -- 100 standards --

13 And we get the question why does NFRC  
14 change the standards, and then I think the overall  
15 answer is that we need to make a change for the  
16 technical credibility of NFRC standards.

17 There's really four reasons why NFRC  
18 made those changes. The first is to keep up with  
19 current technology. As you're aware, let's talk  
20 about software first. Computer software has a  
21 limited shelf life. In fact, a lot of computer  
22 software is obsolete in a year or two.

23 And NFRC bases their ratings for window  
24 performance on computer software. So the advances  
25 in just computer modeling since 1997 have been

1       tremendous, and it's important that NFRC take  
2       those into account when we revise the standards.  
3       So that's one.

4               And the other is in changes to the heat  
5       transfer calculations. There's been a lot of new  
6       technology that's been done, especially through  
7       ISO, International Organization of  
8       Standardization, and Christian is going to talk  
9       about that later. And we use their new heat  
10      transfer calculations in NFRC 100.

11             The second reason we make changes is for  
12      harmonization, which as I already said, talked  
13      about ISO, international standardization. There's  
14      another reason, there's a document out called  
15      NAFS, the North American Fenestration Standard.  
16      This document was actually a tremendous  
17      undertaking between the fenestration industry in  
18      the United States and the fenestration industry in  
19      Canada to try and standardize the product ratings  
20      other than energy performance, it's air, water and  
21      structural.

22             And NFRC saw this work that had been  
23      done, and they actually developed one size for  
24      rating products for air, water and structural.  
25      And they also based in on the metric equation.

1           So NFRC wanted to dovetail into that  
2           action. So NFRC is actually now based on metric  
3           sizes and on one size which are the NAFS sizes, or  
4           at least most of them are. We think it's good  
5           work and we should use it.

6           The third reason is to remove  
7           marketplace confusion. As you know when the NFRC  
8           was first started there was no agreement in the  
9           industry about what's the right size to use. So  
10          we ended up coming up with two sizes, a  
11          residential and nonresidential.

12          Well, between the action of NAFS and  
13          the -- itself, they were able to adopt one size  
14          and this will really make my job easier and  
15          everybody else's jobs, because now there will only  
16          be one size on a label, or one rating with one  
17          size on the label rather than two.

18          And then finally the reason for change  
19          is NFRC's policy is to have republished documents  
20          every four years.

21          The technical changes from 100 are size  
22          changes, then; modeling changes; the rating in  
23          skylights; and the application of the new ISO E  
24          transfer equation. And we'll get into detail with  
25          Christian, again later.

1           The size changes, and this is just some  
2           of them, you can see originally the size changes  
3           were based actually on English, so if you look to  
4           the right side, a casement was a 24-by-48  
5           residential size.

6           And when NFRC went to the new sizes,  
7           we're now metric, and we're still -- and what  
8           we've done is size 24-by-59; it's actually in  
9           between what used to be the residential and  
10          nonresidential size.

11          So there's the size change, residential  
12          to the current and --

13          Modeling changes, and I think I'll leave  
14          this for Christian to talk about, because it is  
15          really in the software. But I did want to note  
16          that skylights is a big change. We used to rate  
17          them on a vertical basis. Now we're rating them  
18          on a slow -- much more accurate rating of how they  
19          perform.

20          ISO5099 is the equation that we're  
21          using. And again, Christian will talk about that  
22          later. Talk about a lot of the effects that made  
23          on the standards. This is the same information  
24          that Christian will talk about and how we're doing  
25          the transfer calculations now, and how it affects

1 the rating of windows.

2 This is a simple chart. There's a lot  
3 more of them around. I know NFRC published  
4 several documents. They've been on the CEC  
5 website. They're available outside on the desk.

6 This is just a general one that shows  
7 the effects of NFRC changes of 100 '97 to 2001.  
8 And again, this is residential sizes only from  
9 '97.

10 And so you can see, for example, in the  
11 case of the lumen -- casement window, in '97 the U  
12 factor rating would have been .48. In the 2001  
13 version that U factor would now be .44.

14 So, yes, Bill.

15 MR. PENNINGTON: Do you have information  
16 on what a metal frame window without thermal  
17 break, what the change would be?

18 MR. BENNEY: I believe I have a -- do I  
19 have a nonthermal broken -- window here?

20 MR. PENNINGTON: Yes.

21 MR. BENNEY: Thermal -- slider, that's  
22 not thermally broken, that's just an aluminum  
23 slider. And in the '97 version you see that --  
24 .61 U factor; under the new 100 would be .52.

25 MR. PENNINGTON: Okay, thank you.

1           MR. BENNEY: And actually we have much  
2 more data out there on the table And I know, for  
3 example, there's other -- has data -- presented.  
4 This -- you might be aware that your products are  
5 going to change depending on the type of product.  
6 This is not, you know, you can't just apply  
7 generic numbers here. This is just some of the  
8 rating we did just to show possible changes within  
9 certain products. But that doesn't mean each  
10 manufacturer is going to get these changes. It's  
11 going to depend on how their product is designed.

12           So each manufacturer is going to have to  
13 determine what the rating changes are.

14           Implementation there's again on the  
15 table -- yes, I'm sorry, Bill.

16           MR. PENNINGTON: Also interested in SHGC  
17 changes, are you prepared to --

18           MR. BENNEY: Actually, no --

19           MR. PENNINGTON: -- speak to that?

20           MR. BENNEY: -- as I said it's very --  
21 .01, .02 changes -- coefficients between the '97  
22 and 2001 ratings. So that really is not a major  
23 impact on the industry.

24           MR. PENNINGTON: And those are -- the  
25 SHGCs would increase or decrease?

1 MR. BENNEY: Depends.

2 MR. PENNINGTON: Depends.

3 MR. BENNEY: Size changes obviously is a  
4 major one for -- if you have a larger glass-to-  
5 frame ratio and the glass is a higher performing  
6 glass then you're going to get a better rating.

7 It depends on the type of product,  
8 because obviously again it's a glass-to-frame  
9 ratio issue, are there mullions involved. You  
10 know, is it an absorbance issue within the framing  
11 systems, themselves, and how those are calculated.

12 I don't know if Christian has some --  
13 numbers on him or not.

14 MR. KOHLER: I don't have numbers, but I  
15 can talk about what constitutes changes.

16 MR. PENNINGTON: We're not picking you  
17 up unless you come up.

18 MR. KOHLER: I'm not going to present  
19 numbers, but I can talk about what constitutes the  
20 changes, what the effects are.

21 MR. PENNINGTON: Okay, thanks.

22 MR. BENNEY: Finally, how are we going  
23 to implement these. And as I said, out on the  
24 table is actually a full schedule that is  
25 available for your use.

1 But basically how this is going to work  
2 is that manufacturers may use the current ratings,  
3 okay, and labels until they expire.

4 Manufacturers may switch to one size  
5 label without recertification, but they have to  
6 use the 1997 residential size rating and indicate  
7 on the label that that's a 1997 rating.

8 Windows can be submitted for ratings  
9 with a new standard this January. However, the  
10 ratings cannot be issued until April 1, 2003.

11 And then finally, April 1, 2004, --  
12 follow up the new rating procedures.

13 So that's basically how the  
14 implementation is going to be. Yes.

15 MR. PENNINGTON: Sorry to interrupt you  
16 again. On the first bullet you say until they  
17 expire.

18 MR. BENNEY: Yes.

19 MR. PENNINGTON: Can you explain --

20 MR. BENNEY: Sure, --

21 MR. PENNINGTON: -- things expire?

22 MR. BENNEY: -- there's a four-year  
23 expiration date on certification products, so if  
24 somebody decides they want to go get them  
25 certified right now in 2002, they wouldn't have to

1 get recertified again until 2006. So they could  
2 actually have 1997 ratings on their product till  
3 2006.

4 So there's a four-year certification  
5 program. That's pretty standard in most  
6 certification issues, a four-year length or term.

7 MR. PENNINGTON: Thanks.

8 MR. BENNEY: You're welcome. That's  
9 really all I have. As I said, the reason we made  
10 the changes is for NFRC to maintain its technical  
11 credibility. When there's changes in our  
12 understanding of the science, we need to apply  
13 those changes in the ratings.

14 Thank you.

15 MR. PENNINGTON: Thank you, Jim.

16 MS. SHAPIRO: I do have one question.  
17 Are we going to have this, or is it already  
18 available on our website? This slide.

19 MR. BENNEY: I have a handout I could  
20 put out on the table if you would like, or --

21 MR. PENNINGTON: We will make it  
22 available on the website, as well.

23 MS. SHAPIRO: Thank you.

24 MR. PENNINGTON: Thank you very much,  
25 Jim. Christian Kohler.

1           MR. KOHLER: Welcome; my name is  
2 Christian Kohler; I'm from Lawrence Berkeley  
3 National Laboratory. I work with Dariush Arasteh  
4 and Steve -- who unfortunately couldn't be here  
5 today.

6           I'm going to talk a little bit about  
7 that magical ISO5099 standard that Jim mentioned a  
8 couple of times. And mainly how it's incorporated  
9 in the software, Window-5 and Therm-5 which is  
10 software that Lawrence Berkeley Lab puts out.

11          First I want to talk about the ISO  
12 standard, what the procedures are behind it,  
13 exceptions and how it came to be.

14          Historically the software tools Window-  
15 therm frame that were used by NFRC were based on  
16 best science as defined by each developer. So  
17 there were kind of everybody individually made up  
18 what they thought was the best software and the  
19 best heat transfer algorithms.

20          When we started ISO project it basically  
21 finalized the standard, which is finalized now is  
22 based on best science as we know it today. The  
23 previous standards that you saw were in 1997 for  
24 NFRC, but the heat transfer really was based on  
25 late '80s kind of research. And so it's much

1 older heat transfer research. The software has  
2 been updated in between, but the major overhaul  
3 we're doing now is from heat transfer knowledge  
4 from the late '80s to 2000, 2001.

5 These committees are basically that  
6 worked on ISO representing national scientists in  
7 the field and so it's not just a couple of  
8 software developers. It's a worldwide effort.

9 NFRC has adopted those ISO5099 standards  
10 for the -- I should say there's a little bit of  
11 confusion. These are called the 2001 standard,  
12 even though they're being published now and come  
13 into effect next year. So whenever I'm talking  
14 2001, it is actually the new latest thing.

15 And LBNL has incorporated these changes  
16 in the ISO into the software. And we've also  
17 participated in the ISO work worldwide.

18 So the first thing I'm going to talk  
19 about, the central glass changes which are in the  
20 Window-5 software program. So here's a list of  
21 the technical improvements, and I'll elaborate a  
22 little bit on each of them, some of them a little  
23 bit more. If you have questions please ask me at  
24 the ends, and I can -- about a specific one.

25 The first one is the gas properties and

1 gas mixes; we've updated that to internationally  
2 accepted heat transfer calculations for gas in  
3 between the layers, the panes of glass.

4 The gap convected heat transfer  
5 algorithms have improved. If you have a window,  
6 the gap between the pieces of glass can be very  
7 long and skinny, if you have a very tall window  
8 with a narrow gap. Or if you have a small window  
9 with a big gap, you have a different aspect ratio.  
10 It will never be a square box, but it will be, you  
11 know, 20-to-1 or 60-to-1. That's been  
12 incorporated now in the software. It used to be  
13 one standard number.

14 The interior surface heat transfer  
15 coefficient is now high dependent. We used to  
16 have a standard convective interior heat transfer  
17 coefficient. Now it -- should change from window  
18 to window, which is, again, makes it more  
19 accurate.

20 All these changes are driven by the need  
21 to become more accurate. And by improved science.

22 For the exterior film coefficient we now  
23 use the blackbody radiation model, which means  
24 there's some temperature dependence in there. And  
25 once again, it used to be just a fixed number.

1           And we modify the solar heat gain  
2       calculations for the central glass. And it has to  
3       do with whether it's summer or winter U factor  
4       used for solar heat gain. That's a very  
5       insignificant change, but it's there.

6           Secondly, I want to talk about the  
7       window frame, the edge of the window, which is  
8       dealt with in our Therm-5 program. And, again,  
9       the technical improvements are we use detailed  
10      radiation model on the interior surfaces of the  
11      frame and the edge of the glass.

12          It's both for condensation resistance  
13      and U factor modeling, but it actually is very  
14      important for condensation resistance. But it  
15      also will make the U factors more accurate.

16          This is one of the bigger changes on the  
17      non thermally broken aluminum windows that we'll  
18      see in the lists of tables that have been out  
19      there.

20          Where should using actual frame cavity -  
21      - temperatures -- heat flow directions. Once  
22      again, it used to be kind of a standard number for  
23      a cavity, only depending on the size. And now we  
24      do a much more, we take more factors into account.

25          Frame cavities are component dependent.

1 The cavities in a frame, for example, in a sill  
2 usually are, you know, about this big or whatever,  
3 with the gravity pointing down. With jamb you  
4 have a long, tall cavity with gravity pointing  
5 down, so the aspect ratio is a long skinny one for  
6 jamb and a little square one for sill. We used to  
7 just have one cavity model, now we differentiate  
8 between vertical and horizontal elements.

9 We've improved the rectangularization of  
10 frame cavities. We've worked on the cavity gas  
11 mix which is complement to what we just showed  
12 about window, the gas mix being improved.  
13 Likewise, we're doing it in therm.

14 There's a thing called slightly  
15 ventilated interior and exterior surface cavities,  
16 which we do a better job at. And we've improved  
17 the modeling of the frame solar heat gain, which  
18 mostly will affect windows that aren't able to  
19 raise the solar heat gain a little bit for frames.  
20 And it's based on the projected area of the frame.  
21 It used to be just the -- so it's projected  
22 versus -- length.

23 Again, if you have questions, ask me. I  
24 don't want to go into a lot of detail on all of  
25 them.

1                   And the convected heat -- was there a  
2                   question?

3                   MR. PENNINGTON: I'm sorry to interrupt  
4                   you, I'm interested if, at some point, I'm not  
5                   sure where the appropriate point would be, maybe  
6                   it's at the end of your presentation, but if you  
7                   could explain what are the primary drivers for the  
8                   U factor change --

9                   MR. KOHLER: Um-hum.

10                  MR. PENNINGTON: -- for metal windows  
11                  that are not thermally broken?

12                  MR. KOHLER: Sure. I'll just jump back  
13                  to these slides and I'll pick a couple out.

14                  MR. PENNINGTON: Okay.

15                  MR. KOHLER: Actually, this is an  
16                  appropriate slide because this is the biggest  
17                  effect on U factor is this radiation model. And  
18                  what I'm showing is two typical cross-sections,  
19                  one of the left and one on the right.

20                  The left one has what we call  
21                  significant self viewing. There's a lot of frame  
22                  that actually is protruding out from the line of  
23                  the glass. So it's sticking in further. So  
24                  there's a part of the glass that's sees the frame.  
25                  What we call seeing is radiation exchanges is by

1       lying on the side. You know, if you put your face  
2       in front of a hot plate, or, you know, your stove,  
3       you feel it. If you put just a piece of paper in  
4       between you don't feel it anymore. So, it's a  
5       line of sight thing.

6               The window on the right is kind of a  
7       flush mounted window. There's not much frame that  
8       sees the glass. So in these two cases, on your  
9       left you would see a significant effect in the U  
10      factor, lowering the U factor because of the  
11      radiation playing a big effect. On the right you  
12      wouldn't see much.

13             Both of these are actually aluminum  
14      products, but like we show, it's dependent on the  
15      kind of configuration. The one on the left, of  
16      course, is a slider, has a bigger effect than the  
17      one on the right.

18             Yes?

19             MR. PENNINGTON: So, the one on the  
20      right, the radiation is having more of an effect  
21      on the conditioned space, is that right, the air  
22      in the conditioned space?

23             MR. KOHLER: Yeah, we assume that the  
24      room is always an even 70 F; all sources in the  
25      room are at room temperature, 70 F. And that's

1 the big difference.

2 On the left we're saying the window's  
3 not just seeing the 70 F warm room, but it's  
4 seeing parts of the frame which might be only 50  
5 or 60 F.

6 So the amount of heat transfer over  
7 there is less because the temperature difference  
8 between the frame and closure, whether it's room  
9 or whether it's part of the frame, is less. And  
10 so, yeah, on the right it would affect the room,  
11 but we always -- we assume the room is what we  
12 call a blackbody at 70 degrees. So, yeah,  
13 definitely.

14 So that was my presentation. I just  
15 picked this one out. Let's just jump back and see  
16 if there's other ones.

17 The interior surface heat transfer  
18 coefficient high dependent can have an effect on  
19 tall windows, such as patio doors. For a standard  
20 slider it's fairly close to what it used to be.  
21 But the taller your product is, the more that is  
22 going to have an effect.

23 That's the main central glass different  
24 once. And the gas properties depends on the gap.  
25 For gap width we used to use millimeters. It

1       could be 6 millimeters like a quarter-inch gap; 12  
2       a half-inch gap or three-quarter inch gap.

3               How it affects actually depends on the  
4       gap width. And there's kind of a minimum -- it  
5       changes a lot at 6 mm; it changes -- it's kind of  
6       neutral at 12 mm; and it goes up a little bit at -  
7       - sorry, it goes down a little bit at three-  
8       quarters of an inch.

9               So, it's really hard to get the general  
10       trend. It really depends on the configuration.  
11       But there's some graphs in the handouts by -- that  
12       you have. It's called something like 104 glazing  
13       systems compared. And that shows how the gap gas  
14       properties and convected heat transfer, those  
15       first two actually affect that.

16              And then, again, the third, the heat --  
17       variation, what I just showed, is the biggest  
18       effect, I would say. That point doesn't make much  
19       of a difference. And the frame solar heat gain  
20       can have an effect on solar heat gain, but not on  
21       the U factor. That's I think what you were  
22       specifically asking about.

23              So I would say on the frame and edges,  
24       mainly the radiation level, it changed a lot.

25              This is my contact. Do you have any

1 questions? Yes.

2 MR. PENNINGTON: Could you go over what  
3 the changes are related to skylights, and do you  
4 have an estimate for the magnitude of the likely  
5 change related to skylights?

6 MR. KOHLER: Yeah, I don't have any  
7 data -- I'm looking at the data that was actually  
8 handed out here. I don't have data prepared here.

9 There's some data -- basically the  
10 skylights we used to rate and test vertically,  
11 right now -- rate, test and simulate vertically, I  
12 should say, now we actually, we simulate under 20  
13 degrees slope and we actually rate them on a 20  
14 degrees slope. Testing is still done vertically  
15 to match up testing the simulation. So, it's one  
16 simulated vertically.

17 Under 20 degrees you actually have a  
18 whole different heat transfer issue, because  
19 normally it's again, it's a gravity thing. If  
20 your skylight is tilted, you know, you get a  
21 stratification right under it. And in a vertical  
22 window it's a whole different world.

23 So the numbers are going up. Some of  
24 the numbers I'm seeing here are the U value from a  
25 5-4 to a 6-3. That's quite a bit higher for the

1 skylights. But, it is a more accurate rating.  
2 And it's the skylight manufacturers within NFRC  
3 were actually happy to get a more accurate rating,  
4 even though their numbers goes up.

5 And traditionally numbers go down,  
6 everything's good; numbers go up, there's  
7 problems. But everybody agreed that this is a  
8 more reasonable way. And these skylights are  
9 never mounted vertically or it wouldn't be a  
10 skylight.

11 But they go up, and the only numbers I  
12 have right here are from that.

13 MR. PENNINGTON: What about SHGC for  
14 skylights?

15 MR. KOHLER: That shouldn't change too  
16 much. There's like what I'm seeing here is a 4 or  
17 5 percent, which is kind of in the range of what  
18 the other windows -- this is an aluminum one, for  
19 example, with a drop, as well.

20 The SHGC is partially determined by the  
21 U factor of the window, the frame and center of  
22 glass. So a big change in U factor will result in  
23 a second order change in solar heat gain. But  
24 it's much less.

25 MR. PENNINGTON: It would seem to be

1       that if you changed the tilt from vertical to a  
2       tilt, that the window's going to see more solar.

3               MR. KOHLER:  Oh, well, that's a good  
4       point.  There's this -- the sun has to know about  
5       NFRC.  The sun always is supposed to shine  
6       perpendicular to the glass.  That's for vertical  
7       glass and that's for skylights.

8               And we know that for a vertical window  
9       the sun hardly ever hits it horizontally, you  
10      know, dead on.  But that's the way all the  
11      calculations are done in the ratings.  So that's  
12      why I'm saying the sun has to know about NFRC, it  
13      has to be in that position.

14              So for skylights it's actually more  
15      realistic because at a slope you'll actually --  
16      you're right, I mean in the real world, in the  
17      nonrating world, you would actually see a bigger  
18      difference.

19              But it's very hard to do sun, because  
20      then you also have to determine, you know, are you  
21      taking June 15th at noon; or, you know, are you  
22      taking June 16th.  You know, so all the properties  
23      are perpendicular incidents.

24              MR. PENNINGTON:  Okay, so that tilt  
25      didn't change the SHGC --

1 MR. KOHLER: Not in that, no, it's  
2 mostly second order effect because the U factor  
3 changed.

4 MR. PENNINGTON: Okay.

5 MR. KOHLER: Not for any of that. But,  
6 yeah, that's a good point. I should have pointed  
7 that out. It's -- you live long enough in that  
8 world, you think of course the sun hits every  
9 window perpendicular, but I guess it doesn't.

10 MR. PENNINGTON: Do you have any  
11 questions? Does anyone have any questions to  
12 clarify what was said, either what Mr. Benney said  
13 or what Christian said?

14 Okay.

15 MR. KOHLER: Thank you.

16 MR. PENNINGTON: All right, I'd like to  
17 turn to the public comments. Ray Bjerrum.

18 MR. BJERRUM: My name is Ray Bjerrum  
19 with Merzon Industries. I'd like to make a couple  
20 comments. I have submitted a written document  
21 that I won't read, but I think you have that --

22 MS. SHAPIRO: We have that.

23 MR. BJERRUM: If anybody wants a copy of  
24 it that didn't get it, I have copies here.

25 One of the things I'd like to say is

1       that I would hope that the NFRC didn't go to one  
2       size to make Jim Benney's job easier.

3               As you would know, and people that have  
4       been around a long time, know that I was here  
5       standing here many years ago supporting the NFRC  
6       procedures. And it split the California window  
7       industry in about half between the aluminum people  
8       that felt they were being unfairly treated, and  
9       people that were supporting NFRC procedures.

10              In fact, I was the chairman of the  
11       original certification policy committee and it was  
12       the State of California that pushed the NFRC into  
13       certification. In fact, they didn't want to do  
14       certification until the state asked them to do  
15       that.

16              And I believed in the good science at  
17       the time. Now I'm told that the computer programs  
18       change and that the new computer programs have to  
19       be updated. Well, physics don't change. Maybe  
20       the computer programs change, but physics don't  
21       change.

22              Early on we had a testing procedure  
23       only, and there was a company in Fresno that only  
24       tested and got a 7.5 on a window that was  
25       supposedly, as we thought, simulated to about an

1 8.2.

2 I launched a challenge, Merzon launched  
3 a challenge against Western Products that went  
4 through the challenge procedure at SCWM and then  
5 on to NFRC. Unfortunately, it got into a large  
6 legal battle, and NFRC and Merzon received a  
7 letter from an inside-the-Beltway lawfirm that  
8 threatened that Ray Bjerrum, with all his friends  
9 in NFRC and CEC, was trying to put this poor  
10 company out of business in Fresno.

11 Now I am just finding out in the last  
12 six months that the number was probably correct.  
13 That by testing the 7.5 will now be -- that 8.2  
14 will probably be a 7.5, and for all these years  
15 I've been out there thinking this process was  
16 great and felt that I've been injured over it.  
17 And our company was injured. And a lot of the  
18 aluminum people were injured over the last ten  
19 years.

20 And I'd also like to point out to the  
21 Commission that what I said in here is there's a  
22 certain amount of unfairness here to the large  
23 size structural windows of which even the Energy  
24 Commission has Blomberg windows here.

25 When you go into larger size and you are

1 really taking a 5030 size that is the U value  
2 5030, when you have that glassed area square  
3 footage that the larger windows that are  
4 structurally stronger, that U value should have  
5 been changed.

6 And if NFRC was really looking toward  
7 the future they would allow some sort of a  
8 certification process that would give the actual U  
9 value per that window.

10 And that's about the points I want to  
11 make.

12 MR. PENNINGTON: Question, Ray?

13 MR. BJERRUM: Yes.

14 MR. PENNINGTON: Do you think it's  
15 inappropriate to change to these new test  
16 procedures?

17 MR. BJERRUM: You see we're in a  
18 conundrum here because if you're still making  
19 aluminum windows you'd like to get this good  
20 number. So, my point is it costs money, as you  
21 saw in there, to make this change. It does affect  
22 people, and that expense should be borne by  
23 somebody because Merzon has to retest all four.  
24 And in our position we'd have to immediately get  
25 to Ken Nittler and say, how fast can you simulate

1       them.

2               And then put that number out on the  
3       street for people to use because obviously it's  
4       going to be more favorable.  So I don't -- what  
5       I'm saying is that in the last ten years there's  
6       been people wronged, and I can't say that this  
7       right or wrong because I'm not a technical person.

8               But if it is right then I'd like to use  
9       it.

10              MR. PENNINGTON:  As a member of NFRC, as  
11       a manufacturing member, is it your expectation  
12       that periodically the test procedures will be  
13       reconsidered and that there would need to be some  
14       updating of ratings based on what the organization  
15       decides is an appropriate change?

16              MR. BJERRUM:  You know I sat here ten  
17       years ago and said solar heat gain was a big  
18       issue.  That California was a dominant in air  
19       conditioning cycle.  And I was told the science  
20       isn't there.  We've got to do U values.

21              And I always said that we've got to do  
22       this, and there was no science for the solar heat  
23       gain.  But we'll get there some day, Ray.  And so  
24       it was unfavorable even though I supported the  
25       NFRC process, they said the science wasn't there.

1           And now we're finding that this was  
2       really modeled wrong and that maybe some of the  
3       test chambers were giving the proper information.  
4       So, updating, yes, but I can't believe that we're  
5       going to change the physical properties of highly  
6       conductive products by this amount. Either it had  
7       to be an error ten years ago, this is not a minor  
8       change.

9           MR. PENNINGTON: Question?

10          PRESIDING MEMBER PERNELL: I have no  
11       questions.

12          MR. PENNINGTON: I'm wondering,  
13       Christian or Jim, or anyone else in the audience,  
14       I don't know if Ken -- is there an error that's  
15       being discovered here that's being changed?

16          MR. KOHLER: Yeah, I'd like to comment  
17       briefly on that, and --

18          PRESIDING MEMBER PERNELL: Christian,  
19       could you state your name for the record.

20          MR. KOHLER: Sorry, Christian Kohler,  
21       Lawrence Berkeley Lab. I just gave a presentation  
22       on the changes.

23                Physics doesn't change, but  
24       understanding of physics does change. I think the  
25       very fact that there is Nobel prizes for physics

1 every year means that something is changing, new  
2 things are discovered.

3 Partially there's a thing with faster  
4 computers, as everybody's aware of, allow  
5 calculations to be done, more complex calculations  
6 to be done more accurately. I mean there's in the  
7 whole building arena is the same thing where  
8 simulations get more accurate because now they can  
9 take more computer time.

10 Another thing I'd like to say about the  
11 test and simulation numbers, traditionally, for,  
12 for example, aluminum windows the test numbers  
13 have been lower than the simulation numbers.

14 And we've done some round-robins in the  
15 past, and looking at the numbers here, for  
16 example, the 99 test round-robin that NFRC did was  
17 an aluminum horizontal slider which was tested at  
18 a .57, and simulated at a .62, which is about a 7  
19 percent, almost 8 percent difference. So, testing  
20 was lower; simulation was higher.

21 Now we're kind of switching it around a  
22 little bit. We're still hovering around that  
23 perfect point, but now the simulations are a  
24 little bit lower than the testing.

25 The test numbers will also change a

1 little bit because testing always uses the film  
2 coefficients of the simulation. We did it in the  
3 past, now you saw my presentation, there's a few  
4 things that change the film coefficient. That is  
5 also going to affect the test numbers. So it's  
6 not that testing stays the same, because physics  
7 stays the same. We actually always adjusted some  
8 of the test parameters.

9 So, I think that's my point about what  
10 happened to the aluminum windows and why that  
11 change was there. And so was it wrong? It was  
12 the best science as known in the late '80s when  
13 these procedures were done. Now we're further and  
14 we have, like I said, an international panel that  
15 worked on these. And we agreed on more complex  
16 calculations which get more accurate results. So,  
17 thank you.

18 MR. PENNINGTON: Charlie Macher. I'm  
19 sorry, Charlie, how do you pronounce your last  
20 name?

21 MR. MACHER: Macher.

22 MR. PENNINGTON: Macher, thanks.

23 MR. MACHER: Charlie Macher with  
24 Blomberg Window Systems. To say that Blombergs  
25 and the Energy Commission has been adversarial in

1 the past is probably a bit of an understatement.

2 We believe now as we believed ten years  
3 ago that we were probably behind the eight ball as  
4 far as the regulations were concerned, and as far  
5 as NFRC's regulating process was concerned.

6 We still believe we are at that point.  
7 Our windows continue to be tested at lower values  
8 than they are simulated at. However, we can't use  
9 the tested values, we use the simulated values on  
10 our labels.

11 I don't know what the end is to this. I  
12 understand that science continues to move on and  
13 improve itself. However, I do feel that we have  
14 been wronged in the past, and there should be some  
15 consideration for that in how the Energy  
16 Commission considers NFRC's procedures in the  
17 future.

18 And I think that's all I have to say  
19 right now.

20 MS. SHAPIRO: Charlie, could you -- I  
21 don't know what you mean, that we should consider  
22 that in the future.

23 MR. MACHER: In the past you have used  
24 NFRC's simulation values as a target number  
25 possibly for your regulations. Well, now that

1       these values are going to drop considerably, and  
2       in some cases, and even in the literature that  
3       NFRC published, there's a 25 percent spread from  
4       what they were in '97.

5               I don't know that the targets should be  
6       lowered in your budgets to that 25 percent. We  
7       have been hurt in the past because they were off  
8       on the other end by as much as 25 percent. Now if  
9       you drop them, we may not be -- we still may  
10      continue to be behind the eight ball.

11             MR. PENNINGTON: A comment on that. In  
12      this rulemaking proceeding that we're in right now  
13      we don't intend to change the U factors or SHGCs  
14      that are in the package requirements in the  
15      standards.

16             MR. MACHER: In the budget? In the  
17      prescriptive packages?

18             MR. PENNINGTON: That the budget is  
19      based on. We don't intend to do that in this  
20      proceeding.

21             We are planning in the 2005 standards  
22      proceeding, which is also ongoing, to consider  
23      whether we should do that.

24             MR. MACHER: The other thing that  
25      happens in your process is that there are default

1 tables. And the default tables were bordering on  
2 a punitive stages for our products. And I would  
3 urge that you consider adjusting them to a more  
4 real scientific area than they are right now.

5 PRESIDING MEMBER PERNELL: Which one is  
6 that? I'm sorry?

7 MR. MACHER: The default tables for U  
8 value and solar heat gain, and the products that  
9 they contain.

10 PRESIDING MEMBER PERNELL: On the issue  
11 of tested value versus simulated value, what is  
12 the industry standard? I mean which one do we  
13 use?

14 MR. MACHER: We use the simulated value  
15 on our labels. The tested value is merely a way  
16 of assuring that the simulated values are  
17 approximate --

18 PRESIDING MEMBER PERNELL: Or close.

19 MR. MACHER: -- or correct, and now that  
20 we find that they may have been correct ten years  
21 ago, but they're not correct now, so I don't know  
22 where the line should be drawn.

23 MR. PENNINGTON: I wonder if, maybe,  
24 Jim, you could explain the relationship of tested  
25 and simulated values? How they work and how one

1 is a check on the other and --

2 MR. BENNEY: Jim Benney, NFRC. In the  
3 beginning NFRC required two thermal tests to  
4 validate simulated ratings. In 1992 there was  
5 concern over whether or not the computer software  
6 was accurate, quote-unquote accurate.

7 And so they actually required two  
8 thermal tests, a large product and a small  
9 product. And then they were simulated, and they  
10 had to be within a certain range to validate the  
11 rating on the software.

12 Now, and actually over time, we've seen  
13 that the software is valid. So we've dropped that  
14 down to one test now. And there's actually been  
15 action in the NFRC to drop validation testing  
16 because everybody, I think, believes that software  
17 is more -- accuracy is a tough term.

18 Software is more equitable. It's easier  
19 to get standard ratings over and over and over  
20 again with software because you're plugging in  
21 numbers and giving out with an output. Whereas in  
22 a thermal test chamber you have various -- we have  
23 variables that will affect how the window tests.  
24 And that not only depends on the lab personnel,  
25 but on the test chamber, itself.

1           So, you know, accuracy -- NFRC wants to  
2   develop standardized, fair, uniform and accurate,  
3   but it's standardized ratings so you compare  
4   product to product. And right now we still are  
5   requiring that simulations be validated by a  
6   thermal test, because it's more of a quality  
7   control check. We want to make sure that  
8   manufacturers are building the windows as shown in  
9   the drawings. That's how it works.

10           MR. PENNINGTON: So you have a tolerance  
11   between the tested value and the simulation?

12           MR. BENNEY: It is plus or minus 10  
13   percent, or .04 of a U factor.

14           MR. PENNINGTON: And what would happen  
15   if the tolerance was exceeded?

16           MR. BENNEY: Then the simulation was not  
17   validated, and you couldn't use the simulated  
18   rating.

19           MR. PENNINGTON: So you had to go back  
20   and re-do the simulation?

21           MR. BENNEY: You had to either -- well,  
22   typically what they did is they'd go in and, you  
23   know, we had experts that would check the test and  
24   check the simulations. See what the problem was,  
25   why it didn't validate.

1 MR. PENNINGTON: So there is, you know,  
2 Ray brought up a point of a contended situation  
3 where there was a fairly significant difference  
4 between the test value and the simulation value.

5 MR. BENNEY: Yes.

6 MR. PENNINGTON: That was resolved by  
7 adjusting the simulation value or re-doing the  
8 simulation --

9 MR. BENNEY: I'm not actually sure how  
10 that was resolved.

11 MR. BJERRUM: I --

12 MS. SHAPIRO: Up to the mike, Ray.  
13 Could you say it on the mike, please.

14 MR. BJERRUM: I'll offer an opinion.  
15 There was an AAMA test called 1503 that had a way  
16 of testing a product with 15 mile per hour  
17 perpendicular wind. Some test chambers. There  
18 was a lot of bad feelings about how people  
19 reported U values, but the 1503 was basically you  
20 blow the wind at it at zero degrees and 68 on the  
21 other size, and then you got watts-in/watts-out,  
22 and that was the test. It was fairly simplistic.

23 The NFRC's test came up with some area  
24 weighted averages. And so there's even a debate  
25 today as to whether U-sub-S, which is pretty much

1       like a 1503 test, and the NFRC has changed it.

2       And I understand they're even changing the

3       physical tests again --

4               MR. PENNINGTON:  So, Ray, I had a  
5       specific question.

6               MR. BJERRUM:  Yeah.

7               MR. PENNINGTON:  Related to this issue  
8       that you had raised earlier about there being a  
9       discrepancy in this one scenario between the  
10      testing and the simulation, was that resolved by  
11      the simulation being adjusted ultimately?  That  
12      was my question.

13              MR. BJERRUM:  No, if you remember back  
14      it was always when people complained you said,  
15      well, you could test everything.  And that was  
16      always here in the naive when we were taking this  
17      testimony.  It could always test.  That was always  
18      the out.

19              But generally people felt that the  
20      physical tests were not reliable and repeatable.

21              MR. PENNINGTON:  Um-hum.

22              MR. BJERRUM:  So, my only point when I  
23      said that is that when I made the challenge I felt  
24      that the test was way off.  The test chamber was  
25      owned by Mike Hodgson.  And people discredited

1       that chamber. And by all rights, that window  
2       today would probably be a 7.5 if simulated.

3               So all I'm saying is whatever you came  
4       up with in 1993 was now going to be correct. But  
5       there will still be a debate as to whether test  
6       chambers are repeatable because the NFRC has  
7       changed many different ways of stripping film  
8       coefficient off and going back to try to get it  
9       within 10 percent.

10              MR. PENNINGTON: Okay, so you agree with  
11       Jim's comment earlier then, one of the problems  
12       with actual testing is the lack of repeatability,  
13       the difficulty to get it to be repeatable?

14              MR. BJERRUM: I have no problem. That's  
15       why I supported NFRC procedure was that the  
16       simulation was more repeatable and it was true  
17       science, and I don't have any problem with it. I  
18       lived with that for ten years and believed in it.

19              MR. PENNINGTON: Okay, thanks.

20              MR. BJERRUM: Does that answer your  
21       question?

22              MR. PENNINGTON: Yes, it does. Charlie,  
23       I wanted to ask you, does your company support the  
24       change to the new test procedures?

25              MR. MACHER: Obviously the new test

1 procedures appear to bring U values down and we  
2 would support that, because U values have been  
3 elevated over the last ten years. And we've  
4 probably lost business unable to comply with  
5 certain jobs and not been able to -- and they have  
6 not been able to use our products on those jobs.

7 So, between a rock and a hard spot,  
8 basically, in that I didn't like the old  
9 procedures. The new procedures are more  
10 favorable, and I still don't know how accurate  
11 they are.

12 Now the other thing is that the Btu over  
13 the last millennium hasn't changed much. And so  
14 we should consider the Btus and not the rating  
15 process.

16 MR. PENNINGTON: Okay. Marvin Stover.

17 MR. STOVER: Marvin Stover from Mikron  
18 Industries. We've been involved in this process  
19 with NFRC from the onset. You know, we're a  
20 supplier to the window industry.

21 I read a quote from Jennifer Unlimited  
22 this morning. It said, "Every time I close the  
23 door on reality it comes through the windows." So  
24 I thought that was appropriate today.

25 (Laughter.)

1           MR. STOVER: You know, I think I  
2       submitted that. I hope you have my paper. If you  
3       do then I won't go through and read all of this.  
4       You know, it does sound like that I'm not in favor  
5       of the changes. I actually am in favor. I would  
6       like to see if the Commission would consider a  
7       delay until some things can be worked out to make  
8       me feel more comfortable with the changes.

9           One, you know, if the costs had been  
10      looked at and studied and there is no incremental  
11      costs or any life cycle costs or annual energy  
12      performance differences with the new NFRC  
13      procedures, then I'm in favor of that, if that's  
14      been looked at.

15          The other issue that I have that I've  
16      noted on my second page is about the labeling.  
17      You know, the labeling issue that's proposed, we  
18      believe, could cause some problems in the code  
19      officials, homeowners, builders, when they look at  
20      these, when you have an old label with old values,  
21      you have new labels with old values and new labels  
22      with new values. That could create some kind of a  
23      confusion.

24          And my recommendation today is that the  
25      CEC hold off until NFRC can come back, in fact

1 push NFRC to come back with a little better  
2 labeling transition so that the code officials do  
3 not get confused in the field, homeowners don't  
4 get confused, and builders don't get confused.

5 You know, we went through a transition  
6 in '97 that was somewhat confusing. And I'd like  
7 to see if we can resolve some of those issues so  
8 we can avoid those pitfalls.

9 So that's all I've got to say.

10 PRESIDING MEMBER PERNELL: Do you have  
11 any recommendations?

12 MR. STOVER: Pardon?

13 PRESIDING MEMBER PERNELL: Do you have  
14 any recommendations for the labeling transition?

15 MR. STOVER: Well, I think there may be  
16 something that we could say, if you put it out  
17 there far enough and you say to the manufacturers,  
18 okay, you know, here's the timeframe out into the  
19 future. And I don't know what that would be.  
20 Maybe 18 months. And says, okay, here's the  
21 cutoff point. And all the old labels disappear  
22 and all the new labels suddenly appear.

23 Right now the transition can occur for  
24 up to four years. You're going to see old labels  
25 and new labels for at least a period of -- well,

1 possibly a period of four years.

2 And if we could come up with a  
3 transition plan that the manufacturers could  
4 accept that says okay, out in the future this is  
5 the cutoff period. You can use old labels up  
6 until this point, and then it's new labels are now  
7 in and the old labels are out.

8 PRESIDING MEMBER PERNELL: Mr.  
9 Pennington, is that correct? The transition  
10 period is four years?

11 MR. PENNINGTON: That was something that  
12 was talked about early on. The way that -- my  
13 understanding of the way that the NFRC process  
14 works is that once you get tested under a test  
15 procedure, that result is good for four years.

16 And so if someone tests right now today  
17 under the old procedures then that value would be  
18 valid for four years. And then at that point it  
19 would expire and they'd have to test under the new  
20 procedure.

21 And so the worst case situation it seems  
22 to me in terms of this overlap would be if  
23 somebody went and tested their window products the  
24 day before they're obligated to use only the new  
25 test procedure, and they used the old test

1 procedure, then they would -- it would be valid  
2 for them for four years to use those results under  
3 the old test procedure.

4 MS. SHAPIRO: It's very similar to how  
5 our appliance standards work, that after a certain  
6 date you can no longer sell an appliance that's  
7 been manufactured after that date. You can keep  
8 on selling the old appliances if they were  
9 manufactured before the date certain.

10 But, in our appliance standards we have  
11 an overlap like that, too.

12 MR. PENNINGTON: We called that  
13 inventory clearance.

14 MS. SHAPIRO: Right.

15 MR. PENNINGTON: And the date of  
16 manufacture is the controlling point. And if you  
17 manufactured them the day before that, you can  
18 sell them until you --

19 MS. SHAPIRO: Until you don't have any  
20 more.

21 MR. PENNINGTON: -- until you don't have  
22 any more, yeah.

23 PRESIDING MEMBER PERNELL: Okay. And  
24 one of your recommendations was a extension of the  
25 proceedings, and now I'm hearing that there's a

1 four-year transition period. So I'm trying to  
2 understand what's the benefit of, you know,  
3 extending this proceeding.

4 MR. STOVER: Well, it really is to see  
5 if we can -- you know, and I'm actually asking the  
6 Commission to push NFRC into maybe a little better  
7 defined labeling transition time. So that you  
8 don't get this overlap and confusion.

9 I think it's going to be confusing.  
10 That's just my opinion. People that I've talked  
11 to said, yeah, it's going to be an issue when the  
12 labels hit the field. You know, the code  
13 officials are going to say, okay, is this old  
14 value, new value, old label, new label. And, you  
15 know, what am I looking at, and what value does  
16 that represent.

17 MR. PENNINGTON: So, could you stay  
18 there? I'd like to hear from NFRC related to  
19 this. What options were considered by NFRC for  
20 this? Was the option of doing something like  
21 Marvin is suggesting proposed? And what was the  
22 organization's reaction to that?

23 MS. SHAPIRO: And, Bill, also Ray seems  
24 to want to say something, too.

25 MR. PENNINGTON: Okay, sorry, Ray.

1 MS. SHAPIRO: Did you want to still  
2 speak, Ray?

3 MR. NITTLER: I'm not NFRC. I'm Ken  
4 Nittler. I'm a member of NFRC and I go to all  
5 these meetings. And NFRC Staff may want to  
6 comment on it, but I can't resist on this one.

7 On the labeling issue, I don't share  
8 what Mr. Stover is saying here. What we're asking  
9 for, to the average building official, let's put  
10 it this way, to the builder, they're going to buy  
11 a product and it's going to have a rating on it.

12 They don't really care whether it's the  
13 old one or the new one. They need a product  
14 that's labeled that meets the compliance  
15 documentation. I just can't picture that few, if  
16 any, if ever somebody's going to ask, oh, my  
17 goodness, is this the new label or the old label.  
18 They need a product that meets their compliance  
19 documentation.

20 And if anything, under the new  
21 procedures, more products are likely to meet  
22 whatever compliance level because generally  
23 speaking the numbers are getting a little bit more  
24 favorable.

25 So, I don't think on the streets it's

1 going to be much of an issue.

2 Now, within NFRC, I'll put it this way,  
3 transition is painful. Okay. NFRC is a national  
4 organization made up of volunteer members, window  
5 manufacturers from all over the country,  
6 government, laboratories, all sorts of people.

7 And the transition periods we set -- one  
8 of the difficulties NFRC faces is we're trying to  
9 administer this program nationally. And in some  
10 marketplaces the manufacturer will find that the  
11 product they came in for a rating, that that four-  
12 year certification period serves their business  
13 needs just fine.

14 And so NFRC has said, and it was well  
15 debated, that that's fine, you can continue to use  
16 that certification period since that's what  
17 program was in place at the time that you did the  
18 ratings.

19 Now, there's another whole class of  
20 manufacturers, and I believe most of the  
21 California window suppliers will fit into this,  
22 that will find that the new ratings are favorable  
23 enough that they'll want to move towards  
24 recertifying to the new values relatively sooner.  
25 And when they do that, the rules in NFRC for

1 labeling require them to use the new label.

2 So I think, as a practical matter,  
3 what's going to happen within a year or some kind  
4 of timeframe like that, two years, you'll find the  
5 vast majority of products are going to be labeled  
6 under the new program.

7 There might be an occasional one under  
8 the old program, but I don't think it really  
9 causes much of a compliance problem, as a  
10 practical matter.

11 PRESIDING MEMBER PERNELL: So you're  
12 saying from a business standpoint in some  
13 instances it would be effective for a manufacturer  
14 or a company to get their product retested?

15 MR. NITTLER: Right. I think, as Mr.  
16 Macher and Mr. Bjerrum are saying, and they're  
17 going to be faced with a decision in the very near  
18 future here, do they continue to use the four-year  
19 certification period they already are entitled to,  
20 or will market conditions here in California move  
21 them towards getting the new ratings.

22 And each manufacturer, depending on what  
23 type of product they make, is going to have to  
24 make some sort of business decision.

25 And so, I mean, I'm in favor of giving

1 full value for any of the ratings that are out  
2 there. Let's give the manufacturers maximum  
3 flexibility. They can use the old ones, they can  
4 use the new ones. And that's sort of what's on  
5 the table, or the way it's been proposed, allows  
6 the maximum flexibility in meeting the  
7 requirements.

8 PRESIDING MEMBER PERNELL: Up until four  
9 years?

10 MR. NITTLER: Right.

11 PRESIDING MEMBER PERNELL: Okay.

12 MR. PENNINGTON: I guess another way I'm  
13 hearing this is that some manufacturers may choose  
14 to not retest and they may choose to use the  
15 values they got under the previous test procedures  
16 for the full term that they were authorized to use  
17 them.

18 And to do what you suggest that we do  
19 and have a date specific after which they no  
20 longer could use that, would actually impose a  
21 cost on those businesses otherwise. That they  
22 would have to retest faster and so -- I mean those  
23 are the people that would be negatively impacted  
24 by what you propose.

25 MR. STOVER: Um-hum.

1           MR. PENNINGTON: And otherwise, people  
2           who had chosen to move to the new test would be  
3           doing that based on a business decision. And so  
4           there wouldn't be any consequence for them of what  
5           you propose unless it happened to be faster than  
6           they wanted to move. But depending on that that  
7           we set here.

8           But otherwise those would be not  
9           affected. So in terms of the whole population  
10          there would be a negative effect on those people  
11          that were required to move faster than they  
12          otherwise would have to, right?

13          MR. STOVER: Well, you know, it really  
14          does depend on that business decision. You know,  
15          I know the aluminum manufacturers in the State of  
16          California who sell in the State of California are  
17          going to want to move really quickly to the new  
18          procedure. The vinyl and wood guys may not be  
19          motivated to do that, which is going to, you know,  
20          NFRC is about fair, accurate, comparable ratings.  
21          And now, all of a sudden, a consumer or anybody  
22          who's buying a product, and maybe the code  
23          officials are not going to be all freaked out as  
24          long as it meets the standard.

25          But the guys that are out there making

1        buying decisions that says, okay, this is what I  
2        want, they're going to be comparing an old label  
3        to a new label, an old value to a new value on a  
4        day-to-day basis. And is that right? Or is that  
5        confusing?

6                And, you know, it's a difficult deal.  
7        It could be a cost to the manufacturers. I'm not  
8        sure. You know, it depends on how they decide,  
9        and what they decide to do with their business.

10               Maybe it needs to be explored more;  
11        maybe it doesn't. I know that when in '97 we did  
12        the transition there were still a lot of  
13        complaints by a lot of people about how we did the  
14        transition. So.

15               PRESIDING MEMBER PERNELL: Did we do it  
16        the same way that's being proposed now?

17               SPEAKER: No.

18               MS. SHAPIRO: No.

19               MR. BENNEY: We had a drop dead date.

20               PRESIDING MEMBER PERNELL: We have some  
21        room at the table so you guys won't have to keep  
22        getting up backwards and forth. Why don't you  
23        join us, Jim.

24               MS. SHAPIRO: And Ray.

25               PRESIDING MEMBER PERNELL: And Ray.

1           MR. BENNEY: Jim Benney. Actually Ken  
2 could probably speak to this better because he was  
3 also involved, we were both on the board. In '97  
4 there was a drop dead date --

5           MS. SHAPIRO: Right.

6           MR. BENNEY: -- that was required. And  
7 it was very difficult for manufacturers. And I  
8 think that's why we're providing more leeway at  
9 this time is because of the hue and cry from 1997.

10          MS. SHAPIRO: What Marvin is proposing  
11 now, that's my memory of it. Ray.

12          MR. BJERRUM: I was at a meeting with  
13 NFRC and Western Region AAMA, we had a meeting  
14 with Scott Matthews over this because it was  
15 unfavorable to aluminum in '97. And I was  
16 complaining because the fact that we had brochures  
17 out there with certain numbers on them that were  
18 going into MICROPAS program that are being burned  
19 onto the blueprints and there was no way that if  
20 we were going to have to raise our window from a  
21 7.2 to 7.4 or something it caused a problem.

22                 So the Commission actually let both go  
23 on, because the NFRC at that point had said you  
24 got to go here and there. And then the Commission  
25 said, fine, let them both ride out until people go

1 through their recertification process.

2 But I'd like to point out something  
3 about how this works on this labeling issue  
4 because like with Merzon we sell direct to the  
5 major builders and we need to get numbers to the  
6 calculation people, the CABEC type people, or the  
7 HVAC people.

8 And my fear, to point out to the  
9 Commission, is that if I went to Ken Nittler as  
10 the WestLab and got my window done first, and I  
11 have a U value that is favorable to Merzon at an  
12 expense, like I pointed out in the -- it's going  
13 to be extra expense.

14 But then do I give that to a Mike  
15 Hodgson of Consol or a Donald P. Dick in Fresno  
16 and say, now tell the builders they can calculate  
17 at this, because if the house comes into  
18 production on April 1st when NFRC says I can put  
19 that label on there, then I have an advantage over  
20 people that haven't done it, if we chose to do it.

21 And that would be a matter whether I can  
22 get through WestLab, but I can't put the window --  
23 the label, I'm not certified to put the label on  
24 the window until April 1st by NFRC rules. But I  
25 could have the number on the street, and have an

1 advantage over other window companies.

2 MR. PENNINGTON: I don't understand the  
3 point.

4 MS. SHAPIRO: Couldn't they do that,  
5 too?

6 MR. BJERRUM: Well, once I know what the  
7 U value -- say our U value is going to be a 6.7  
8 from the 7.4 --

9 MR. PENNINGTON: We're going through a  
10 rulemaking to make this change, so there's an  
11 effective date that would be associated with this  
12 rulemaking. So you couldn't do what you suggested  
13 to --

14 MR. BJERRUM: You would have to then, in  
15 this rulemaking you'd have to tell the CABEC  
16 people, anybody that has a MICROPAS program in  
17 their possession, they cannot calculate until  
18 April 1st.

19 MR. PENNINGTON: Right.

20 MR. BJERRUM: And how would they know  
21 the different -- what U value would they know,  
22 that you're giving them a U value, say that's our  
23 U value. How would they verify that, the 7.4 that  
24 Merzon had before April 1st is now a 6.7 after  
25 April 1st?

1 MR. PENNINGTON: Through NFRC  
2 certification.

3 MR. NITTLER: Well, what Ray's  
4 describing, I believe is probably true, that there  
5 will be consultants and the builders they work for  
6 trying to take advantage of the better performing  
7 products you get with the new ratings.

8 The piece of the argument that I don't  
9 know, I don't know that we can do any better,  
10 basically draw a line in the sand. Pick any date  
11 you want. The exact same thing he's describing is  
12 going to happen.

13 At some point enterprising consultants  
14 and builders are going to recognize hey, the  
15 product coming through the pipeline is going to  
16 have a better rating, and they're going to want to  
17 take advantage of it.

18 MS. SHAPIRO: Um-hum.

19 MR. NITTLER: And so whether it's April  
20 1st or July 1st or December 31st, you're going to  
21 have the same effect.

22 Now, one other aspect from talking to --

23 PRESIDING MEMBER PERNELL: That  
24 opportunity will be available to everyone.

25 MR. NITTLER: Right. I think part of

1        what Ray has at least told me privately is so a  
2        second issue then is as a business decision as a  
3        manufacturer he wants those -- he decides that  
4        he'd like to go for the new ratings. And then the  
5        question is, is there enough laboratory capacity  
6        within the NFRC world to provide those ratings to  
7        everybody that wants to come.

8                    And that's a pretty good question. I  
9        think to a large extent the answer is yes, there's  
10       probably enough lab capacity if people start  
11       scheduling and preparing.

12                   I think inevitably what happens, though,  
13       is people don't respond until the deadline's  
14       looming, so the people that decide this March 31st  
15       are definitely going to have a problem. The  
16       people that decide sooner to act can be  
17       accommodated, I believe, with the laboratory  
18       structure we have.

19                   PRESIDING MEMBER PERNELL: All right.  
20       Anyone else?

21                   MR. PENNINGTON: Marvin, you had  
22       mentioned a concern about cost effectiveness, and  
23       I didn't understand your concern. Could you  
24       elaborate on that?

25                   MR. STOVER: Well, you know, I know that

1       when the CEC went through this originally back  
2       when NFRC was formed, and it first went into Title  
3       24 there was a lot of math that was worked through  
4       to make sure that you were getting the energy  
5       savings that you said based on the cost of the  
6       windows, which interpreted into the cost of the  
7       house.

8                You know, when I read what this hearing  
9       was about and it reflected on minor changes, I  
10      said, okay, well, has the math been done again,  
11      you know, has the staff from CEC crunched all the  
12      numbers over again to say, okay, that that's not  
13      true. Or there is no effect. Or it's a better  
14      advantage or worse advantage. You know, are there  
15      cost increases or decreases that should be  
16      accounted for in the model.

17              And if that's been done, I'm happy. If  
18      it hasn't been done, then my recommendation is  
19      that the CEC do that to make sure that there isn't  
20      an effect, adverse or positive. If it is  
21      positive, you need to know that. If it's  
22      negative, you definitely need to know that before  
23      this goes into effect.

24              MR. PENNINGTON: Generally the Energy  
25      Commission doesn't re-do cost effectiveness

1 analysis whenever there's something that happens  
2 in the marketplace to change the cost of a  
3 product, or, you know, something like that.

4 The overall statutory requirement that  
5 the Commission has is that the standards be cost  
6 effective in their entirety when compared to  
7 historic practice. And that's the legal  
8 restriction.

9 And the cost effectiveness of the  
10 standards against that criteria is there's no  
11 question whatsoever about the cost effectiveness.

12 Will this change the cost effectiveness  
13 sort of on the margin between competing measures?  
14 Maybe. That's largely an issue that is up to the  
15 marketplace to decide. You know, this generally  
16 comes down to, in terms of compliance, when a  
17 builder is choosing among complying products, can  
18 one feature accomplish a greater energy benefit in  
19 the performance standards for its cost than  
20 another feature.

21 And so largely that decisionmaking is  
22 done in sort of, you know, in the fields at the  
23 time that the builder is making the decision.

24 I think in general we're just trying to  
25 true up to a new test procedure here. And the

1       implications are relatively small, with probably  
2       the most significant one being the U factor for  
3       the unbroken metal windows.

4               And so at this point we're not planning  
5       to get into doing some revisiting of cost  
6       effectiveness analysis. In the future it would be  
7       expected that we would want to maybe adjust the U  
8       factors, or the SHGCs of our basecase and take  
9       that account into account in future considerations  
10      of changes to the standards. We're not proposing  
11      to do that in this rulemaking proceeding.

12             I mean it really would come into play  
13      primarily if we were considering a change to the  
14      window basis of the standards, that would be where  
15      it would be most fundamental. And we're not  
16      proposing to do that either in this rulemaking  
17      proceeding or in the 2005 building standards  
18      proceeding.

19             MR. STOVER: Don't you look at the cost  
20      of the building or the improvements versus the  
21      savings. And if the costs -- if one of the  
22      portions of the math changes wouldn't you have to  
23      look at that over again? And that's what I'm  
24      saying. I think that you need to make sure that  
25      some component of the math didn't change.

1                   And if it didn't change then it's minor.  
2           If it did change, it could be not minor. I guess  
3           that's, you know, I do forecasting and budgeting  
4           for our company, and believe me, if a portion of  
5           the math changes I get real excited about the  
6           model and how it may change. And what that looks  
7           like, you know, for our company.

8                   So that's my question. If one basis or  
9           denominator or fraction of the mathematical  
10          equation changes, it needs to be looked at. My  
11          recommendation.

12                   MR. PENNINGTON: Okay, thanks.

13                   MR. STOVER: Thank you.

14                   MR. PENNINGTON: Is there anyone else  
15          that would like to speak? I'm sorry, Ken, you  
16          were next, actually.

17                   MR. NITTLER: Thank you. I'm Ken  
18          Nittler from Enercomp. You know me from building  
19          standards activities, but I also operate a  
20          business called WestLab that's an NFRC-accredited  
21          laboratory. And we count many of these folks from  
22          the fenestration industry as customers in that  
23          business.

24                   I want to tell you the short version  
25          here is that I do support this rulemaking. I do

1 have one very important change that I'd like to  
2 propose, and that has to do with which standards  
3 are referenced.

4 We just had a discussion a few moments  
5 ago about this transition period between the  
6 existing NFRC ratings and the new ones. And I  
7 think our standards should reflect that.

8 And every place in the draft or the  
9 express terms that were published where it crossed  
10 out, for instance, the 1997 edition, and then just  
11 referenced the new one, I really think it would be  
12 correct to say 1997 or the 2001 edition.

13 And, you know, understand that we're  
14 working towards new building standards here, as  
15 well. I don't think we need to handcuff the  
16 ability of a manufacturer to use the existing  
17 rating in our standard for as long as their  
18 certification period is valid.

19 We did language like this in the 1998  
20 standards that referenced both NFRC 1991 and NFRC  
21 1997. So we've done it before. And it's pretty  
22 much just drop an "or", remove the strikeout of  
23 the year, and I think that is a very important  
24 change that we should make sure we do.

25 PRESIDING MEMBER PERNELL: Would that

1 just -- off-the-cuff comment, if you made that  
2 change and didn't put an end date on the '97, does  
3 that then send a message that you have two  
4 different standards out there?

5 MR. NITTLER: You see, my idea of this  
6 rulemaking, the point was to say that when you  
7 look at the big picture and you look at national  
8 needs and EnergyStar programs and other states  
9 with other codes, that we need a way to provide a  
10 transition for manufacturers to go from current  
11 ratings to the new ratings.

12 PRESIDING MEMBER PERNELL: Right,  
13 understand.

14 MR. NITTLER: And we don't want to, for  
15 those manufacturers that make a business decision  
16 that says the current ratings are adequate for the  
17 market they serve, let's let them use the ratings  
18 for their full value.

19 Now within the NFRC program that is a  
20 date certain. The most they could possibly last  
21 would be four years. As a practical matter, you  
22 know, most of them are products are spread out,  
23 they're mid-cycle, so maybe the average timeframe  
24 is two years.

25 MS. SHAPIRO: But, Ken, I don't

1 understand if we put into the standards that you  
2 could use the '97 or the 2001, why couldn't  
3 someone -- we would have to make a change again  
4 later.

5 MR. NITTLER: No. NFRC will no -- after  
6 a certain timeframe that Jim Benney had a slide up  
7 there, was it April 1, 2004?

8 MS. SHAPIRO: Four, yeah, yeah.

9 MR. NITTLER: NFRC will no longer  
10 certify new products to the old standard. But  
11 there still could be one that was certified say  
12 today that still has a valid 1997 rating that  
13 could last beyond that date.

14 MS. SHAPIRO: I think that's our intent.

15 MR. PENNINGTON: Yes.

16 MS. SHAPIRO: And maybe we need to make  
17 sure that what we are doing does that. Because  
18 what you're saying is what I understood these to  
19 do. If you had a valid label, that label was  
20 valid until it expired.

21 MR. PENNINGTON: I think the comment is  
22 a valid comment. I think what's proposed here in  
23 draft here is not clear enough.

24 (Parties speaking simultaneously.)

25 PRESIDING MEMBER PERNELL: What we want

1 to do, as long as everybody got the concept, what  
2 we want to do, from the Committee's standpoint, is  
3 be as clear as possible when you're dealing with,  
4 you know, folks in the field and across the  
5 country. I'm assuming that you want to be as  
6 clear as possible so that there won't be any  
7 question or ambiguity there.

8 MR. RYGG: Quick comment. Tony Rygg of  
9 the Commission Staff. Recognize the difficulty  
10 that Ken has pointed out here, and I have draft  
11 15-day language to address it, explicitly or with  
12 great clarity, recognizing NFRC implementation  
13 schedule.

14 The second small subtlety you can look  
15 for in 15-day language, and that is moving the  
16 actual site of the document from the reference  
17 section to the definition section. I understand  
18 from our attorneys that the reference section is  
19 not a binding part of the regulation. So we'll  
20 move it up to where it is a binding part, and make  
21 it clear at the same time.

22 PRESIDING MEMBER PERNELL: All right.

23 MR. NITTLER: Couple other comments I'd  
24 like to make. I do -- this goes back to some of  
25 the questioning Bill Pennington was making

1       regarding the performance or how these ratings  
2       differ. And I prepared a handout that I've used  
3       in a couple different forums in the last number of  
4       months that shows some of our research, WestLab's  
5       research into what these new ratings mean.

6               And if I had to give a summary, Bill was  
7       asking some questions regarding, you know, what's  
8       the biggest change. Very clearly, as Christian  
9       said, the biggest change is related to the  
10      introduction of this radiation model.

11             The average sort of values that I'm  
12      thinking are appropriate here is that aluminum U  
13      factors are dropping 12 percent. This table also  
14      has solar heat gain numbers. The solar heat gain  
15      coefficient --

16             MS. SHAPIRO: Could we have copies, too,  
17      please?

18             MR. NITTLER: The solar heat gain  
19      coefficient on aluminum-frame products is also  
20      going down. And the average that I find most  
21      credible is 6 percent, minus 6 percent.

22             What's a little bit tough to describe is  
23      our current standard has five different U factors  
24      associated with windows in the prescriptive  
25      packages. There's a .75 window that has clear

1 glass. There's a .75 U factor window that has low  
2 solar low E.

3 And the reality is that real products,  
4 when you buy a window you get one product that has  
5 both U factor and solar heat gain. You can't  
6 really decouple them the way we have in the  
7 standard.

8 And so these numbers, these averages  
9 that I'm suggesting to you are the averages of  
10 horizontal sliding product, which tend to have the  
11 higher U factors. The values in our packages, the  
12 .65, .75 were mostly chosen so that an entire  
13 building's worth of windows, that the sliding  
14 glass door, the picture window, the horizontal  
15 slider or vertical slider could all be used and  
16 still beat that value. So that's why I'm using  
17 the horizontal slider numbers.

18 The other average that is important in  
19 our market right now, vinyl products. When you  
20 look at it this way are going down 6 percent on U  
21 factor. The solar heat gain is going up  
22 marginally, around 1 percent up on that type of  
23 product.

24 Now, the solar heat gain on the lower  
25 conductance frame products is probably not a huge

1 business issue for most people because those  
2 products with a good low solar gain, low E easily  
3 beat the .4 solar heat gain numbers you find in  
4 our standard. Those products are typically down  
5 at .33, .35, .32. So it's not going to affect  
6 what I call the critical values that we find in  
7 our standard very much.

8 So I thought that these numbers might  
9 shed some light on what's going on.

10 The bottom table on the page that has  
11 two tables --

12 MS. SHAPIRO: Wait, just stop for a  
13 second. Let me see what it's saying --

14 (Pause.)

15 MS. SHAPIRO: Okay, go ahead.

16 MR. NITTLER: The bottom table on this  
17 data sheet is my best stab at taking the data that  
18 Christian was talking about and trying to load it  
19 into the same format so you could see somebody  
20 else's analysis of how these ratings are changing.

21 I would note that the rating on the top  
22 table, the WestLab data, is for what I'll call  
23 west coast or California style residential  
24 product. Not all the values in the bottom table  
25 are for residential product. Some of them are,

1       it's kind of heavier duty commercial type  
2       products.

3               MS. SHAPIRO:  Why is this table on the  
4       bottom right-hand side say Alaska?  Alaska did  
5       this comparison?

6               MR. NITTLER:  Well, just like goes on  
7       around here during the standards development  
8       process, is the exact answer I might give you if  
9       it was after a hearing in May might be different  
10      after a hearing in July based on the input of the  
11      organization and small changes in the rules and  
12      how calculations are to be done or constants and  
13      stuff like that.

14              So, really what this page represents is  
15      our best stab at doing a rating that's consistent  
16      with all the rules that NFRC has published  
17      regarding these new ratings, including the new  
18      software.

19              MR. PENNINGTON:  Rosella, this --

20              SPEAKER:  Presented at Alaska.

21              MR. PENNINGTON:  -- this was presented  
22      at Alaska.

23              MS. SHAPIRO:  At Alaska, so that's  
24      just -- yeah.  That's what I wanted to know.  At  
25      an Alaska meeting.

1 MR. NITTLER: Right.

2 MR. PENNINGTON: Right.

3 MS. SHAPIRO: Got it.

4 PRESIDING MEMBER PERNELL: Is everybody  
5 in agreement with the table? I mean is this  
6 something that we can also put up on our website?

7 MR. PENNINGTON: Oh, sure.

8 MS. SHAPIRO: We should put it up  
9 because Ken has presented it, so it should  
10 definitely go as a --

11 MR. NITTLER: I can provide it  
12 electronically.

13 MS. SHAPIRO: Thank you very much.

14 MR. PENNINGTON: Maybe not as pretty a  
15 color.

16 MS. SHAPIRO: Yeah, maybe a bigger size,  
17 too.

18 PRESIDING MEMBER PERNELL: All right,  
19 Ken, I'm sorry for interrupting.

20 MR. NITTLER: Just a couple other  
21 comments in response to some of the other  
22 testimony. On skylights that's probably the one  
23 product where there's, you know, a significant  
24 other change that affects the ratings.

25 And as Christian pointed out earlier, it

1 is the tilt, that it's modeled at a 20-degree  
2 slope. My experience would say that the typical  
3 change is the U factor on skylights that's going  
4 to go up on the order of 20 percent.

5 Now, in a standards context, skylights  
6 are a tiny fraction of the fenestration product  
7 installed. So I don't think there's a significant  
8 energy impact on that one.

9 I guess just one final comment is as I  
10 mentioned a minute ago, you know, the transitions  
11 are a struggle. You see that around here. At  
12 NFRC, in the world that NFRC works in, as I  
13 mentioned, there are many manufacturers in many  
14 different states with many different market  
15 conditions. You know, in a perfect world NFRC and  
16 those of us that are supporting it would show up  
17 with just a landslide of data and proof and tests  
18 and samples and all kinds of things that would  
19 make the discussion of these matters easier.

20 But the facts are it's largely a  
21 voluntary organization; it's not always possible  
22 to come prepared with everything about how the  
23 world's going to look in the future.

24 I believe from working in the NFRC arena  
25 here for ten-plus years that, you know, this is

1 done by committee. NFRC really, if you looked at  
2 the numbers and the membership, is really  
3 dominated by manufacturers. It's probably five or  
4 six to one for our manufacturer category versus  
5 any other.

6 And things like changing the product  
7 size, which by the way was something I didn't  
8 personally support, was the will of the group; was  
9 the will of the window industry, if you will, that  
10 were at those meetings.

11 And so, you know, when you make these  
12 transitions, trying to plan for an orderly way to  
13 move from an old standard to a new one, you heard  
14 Mr. Benney describe the way NFRC did it in '97.  
15 It said, okay, everything after this date is junk.  
16 And that causes one class of manufacturer and labs  
17 and everything else to be affected. And they  
18 don't like that.

19 Another way is probably closer to what  
20 we're describing here, which is we're trying, for  
21 better or worse, the certification period is four  
22 years in the NFRC program. We're trying to say  
23 okay, we'll let people take the full benefit, if  
24 it's in their business interest to do so. It's  
25 something I'm a big proponent of. I think if

1       that's what the program's rules were on the date  
2       that somebody got certified, let's let them use  
3       the numbers.

4               And I don't think the labeling issue and  
5       what the building codes or building standards  
6       arena is really cares that much, with all due  
7       respect to my NFRC peers here, what label, you  
8       know, which format and how big the numbers are,  
9       stuff like that. It's not something that greatly  
10      affects the building department's checking these  
11      labels.

12             Thank you.

13             PRESIDING MEMBER PERNELL: All right.

14             MR. BJERRUM: I'd like to point out the  
15      same thing, follow up on what Ken said. There has  
16      not been a lot of data out there since a lot of  
17      manufacturers that aren't even aware how much this  
18      is going to change. So you're going to get a lot  
19      more as time builds up, people questioning this.

20             But I would like the Commission, as  
21      you're going through this rulemaking process here,  
22      you ought to take and have Ken do some projections  
23      on how budget houses would be affected by this  
24      amount of change.

25             I took and just kind of extrapolated

1 from what Ken gave us in this listing and figure  
2 that a house with aluminum windows is going to be  
3 at least a half a kBtu different, and maybe some  
4 of the stakeholders would have some questions on  
5 that as that becomes apparent.

6 And I don't know if Ken's done the work  
7 and tried them out at all, but that's what we  
8 found.

9 MR. PENNINGTON: I'm wondering if  
10 there's anyone else that would like to speak?

11 PRESIDING MEMBER PERNELL: Anyone else  
12 who would like to speak on this issue to the  
13 Committee?

14 MR. MATTESICH: Mr. Chairman, Jim  
15 Mattesich with Livingston and Mattesich. I've  
16 represented Blomberg Windows for a number of years  
17 on these issues and have appeared before you  
18 during that time.

19 And I don't want to repeat what Mr.  
20 Macher said. I thank you for noticing me twitch  
21 and jump up in the back of the room when you asked  
22 if there were further comments, and I didn't see  
23 Charlie jump up. But he's advocated for the  
24 company already.

25 I just want to say that we hope to work

1 with Bill and the rest of the staff on the 2005  
2 process to make sure that this little bit of  
3 restoring some equity for aluminum windows which  
4 we think is appropriate doesn't somehow evaporate  
5 during the next go-round, with other suggested  
6 changes which might adversely unfairly impact the  
7 aluminum window industry.

8 Thank you for noting me, again, and  
9 that's the extent of my comments.

10 PRESIDING MEMBER PERNELL: Thank you;  
11 you're quite welcome. Mr. Pennington.

12 MR. PENNINGTON: Okay. Thanks very  
13 much. Just in terms of next steps, as Tony was  
14 saying, it looks like staff's going to have some  
15 proposed 15-day language.

16 And so we would -- the Commission would  
17 be obligated to consider that after the 45-day  
18 time period is over.

19 So the notice of proposed action, I'm  
20 not sure if I can put my hands on it right -- here  
21 we go -- proposed adoption on December 11th. We  
22 wouldn't, if we're going to pursue 15-day language  
23 we wouldn't propose adoption on December 11th. It  
24 would be two business meetings after that  
25 probably, so it would be about a month later. I'm

1 not sure what the business meeting calendar in  
2 early January looks like. But it would have to be  
3 at least 15 days after this.

4 So, we're talking --

5 MS. SHAPIRO: Well, not necessarily,  
6 because if the 45 days landed before December  
7 11th, but anyway, I think we're talking early  
8 January.

9 MR. PENNINGTON: Right.

10 MS. SHAPIRO: Right.

11 MR. PENNINGTON: And so I'm not even  
12 sure, maybe you know that --

13 MS. SHAPIRO: No, we don't know --

14 MR. PENNINGTON: -- January 7th or 9th  
15 or somewhere in there --

16 MS. SHAPIRO: Yeah, I would say the  
17 first business meeting in January.

18 MR. PENNINGTON: -- first business  
19 meeting in January is where we would --

20 PRESIDING MEMBER PERNELL: Right, and  
21 then once you get back to your office and get the  
22 date, and then that would be posted, so that  
23 everyone will know; as well as the corrected  
24 adjusted dates because of the 45-day language.

25 MR. PENNINGTON: Right.

1                   Okay, and that's all I had to say.

2   Appreciate people coming and making their  
3   comments.

4                   PRESIDING MEMBER PERNELL: All right,  
5   let me just close out by saying I also appreciate  
6   people coming, and we have -- this Committee has a  
7   saying that if you don't show up we don't know you  
8   have a problem.

9                   So don't be discouraged by showing up to  
10   these, even though this is, you know, we don't  
11   have 100 people in this room, and probably glad of  
12   that. But it's always good to be active and  
13   participate in the process. And if you don't,  
14   then, you know, it's hard to get your point  
15   across.

16                   So we do encourage participation. And  
17   so, again, I want to thank you for coming. Mr.  
18   Pennington will have this information up on the  
19   website with the corrected dates. Looks like we  
20   will -- staff has heard a number of you, and we  
21   are having a 15-, 45-day -- what is it, 15-day --

22                   MS. SHAPIRO: We're doing 45-day now,  
23   and at the end of that 45-day, --

24                   PRESIDING MEMBER PERNELL: We're going  
25   to do a 15-day --

1 MS. SHAPIRO: -- 15-day --

2 PRESIDING MEMBER PERNELL: -- so that --

3 and a lot of that is incorporating some of these  
4 suggestions that you have made. So we do  
5 appreciate that and with your involvement we will  
6 get something out to the industry that everybody  
7 might not be happy with, but certainly everyone  
8 can live with.

9 Thank you, again.

10 (Whereupon, at 11:50 a.m., the hearing  
11 was adjourned.)

## CERTIFICATE OF REPORTER

I, PETER PETTY, an Electronic Reporter,  
do hereby certify that I am a disinterested person  
herein; that I recorded the foregoing California  
Energy Commission Hearing; that it was thereafter  
transcribed into typewriting.

I further certify that I am not of  
counsel or attorney for any of the parties to said  
hearing, nor in any way interested in outcome of  
said hearing.

IN WITNESS WHEREOF, I have hereunto set  
my hand this 27th day of November, 2002.

PETERS SHORTHAND REPORTING CORPORATION (916) 362-2345
